

# Safer Snorting

- The hepatitis-C virus can be transmitted by sharing snorting tubes.
- The hepatitis-C virus is wider spread and more infectious than HIV.
- Even small amounts of dried blood residue can lead to a hepatitis-C infection.

## ***Protective measures can easily be taken:***

- Use a clean surface. It is recommended to clean the snorting surface with an alcohol swab before consumption.
- Always use your own snorting tube.
- Do not share your snorting tube with others.
- Sharp edges of snorting tubes can cause lesions in your nasal mucous.
- Do not use rolled-up bank notes for snorting. They might be contaminated with germs and viruses.
- Take care of your nasal mucous. Use saline solution nasal spray after consumption.

## **Rapid testing for HIV and Hepatitis:**
